(54) Title: **DISPOSABLE ABSORBENT ARTICLE EMPLOYING ODOR REDUCTION LAYER CONTAINING METALPH-  
THALOCYANINE MATERIAL**

(57) Abstract: The present invention is directed to a disposable absorbent article. The disposable absorbent article of the present invention includes a fluid storage layer disposed between the topsheet and backsheets and having a body-facing surface and a garment-facing surface opposing the body-facing surface. The fluid storage layer contains a superabsorbent material. The disposable absorbent article further includes an odor reduction layer disposed at either the body-facing surface side or the body-facing surface side of the fluid storage layer. The odor reduction layer contains a metalphthalocyanine material. The disposable absorbent article further includes an isolation means disposed between the superabsorbent material and the odor reduction layer for isolating the metalphthalocyanine material from contacting at least a part of the superabsorbent material.

DISPOSABLE ABSORBENT ARTICLE EMPLOYING  
ODOR REDUCTION LAYER CONTAINING  
METALPHTHALOCYANINE MATERIAL

5

10

FIELD

The present invention relates to disposable absorbent articles. More specifically, the present invention relates to disposable absorbent articles which employ an odor reduction layer containing a metalphthalocyanine material. Examples of such disposable absorbent articles include disposable underwears, disposable diapers (adult and baby) including pull-on diapers and training pants, disposable panties for menstrual use, and disposable absorbent pads including sanitary napkins.

15

BACKGROUND

A wide variety of disposable absorbent articles are designed not only to be efficient in the absorption of body fluids such as urine, blood, menses and the like, but also to be sanitary and comfortable in-use, are known in literature. Disposable absorbent products of this type generally comprise a fluid-permeable topsheet material, an absorbent core (or a fluid storage layer), and a fluid-impermeable backsheet material. Various shapes, sizes and thicknesses of such articles have been explored in an attempt to make their use more comfortable and convenient.

20

25

For some time now, studies for such disposable absorbent articles have been primarily focused on the absorptive capacity of the article. As a result, various absorbent polymers with high absorptive power have been developed. Such known superabsorbent materials (also known as hydrogel-forming

30

absorbent polymers) are capable of absorbing from about 30 to 60 grams of water per gram of polymer.

More recently, research has been focused on the removal of foul odors and the prevention of skin diseases such as dermatitis, rash and redness caused by wearing a disposable absorbent article for a relatively long time. Many body fluids have an unpleasant odor (or an malodor), or develop such an odor when in contact with air and/or bacteria for prolonged periods. Additionally, urine and/or other exudates absorbed into the absorbent article are converted to ammonia by urease produced by skin-flora, *i.e.*, a group of normal microorganisms on the skin. This ammonia, in turn, may cause dermatitis, rash and/or other forms of skin irritation. Such disease of the skin in infants can be a serious medical matter which, in extreme cases, can result in death.

Antimicrobial materials and bactericides in general are chemical compositions that are used to prevent microbiological contamination and deterioration of products, materials, and systems. Such antimicrobial materials and bactericides can also effectively work for the removal or reduction of foul odors developed from disposable absorbent articles which has already absorbed body fluids. However, depending on the manner of the application of antimicrobial materials or bactericides in disposable absorbent articles, it is found that such antimicrobial materials and bactericides tend to affect the absorptive capacity of disposable absorbent articles.

For example, Japanese Patent (Kokoku) Publication No. H4-17058 discloses a disposable diaper which includes an absorbent layer containing a superabsorbent material and a antimicrobial material included in the superabsorbent material. Similarly, Japanese Patent (Kokai) Publication No. H5-277143 discloses a disposable diaper which includes a superabsorbent material containing an odor reduction material. Metalphthalocyanine derivatives are disclosed in H5-277143 as examples of the odor reduction material. Further, Japanese Patent (Kokai) Publication No. S64-25856 discloses a sanitary napkin which includes an absorbent sheet including a

superabsorbent material and a metalphthalocyanine derivative as an odor reduction material. In those structures disclosed, the antimicrobial or odor reduction material is in contact with the superabsorbent material, as a result, the absorptive capacity of the superabsorbent material tends to be decreased  
5 because of the existence of the antimicrobial or odor reduction material.

Based on the foregoing, there is a need for disposable absorbent articles whose absorptive capacity is not affected by the use of a metalphthalocyanine or its derivatives as an odor reduction material.

10

### SUMMARY

The present invention is directed to a disposable absorbent article. The disposable absorbent article of the present invention includes a topsheet and a backsheet combined with the topsheet. The disposable absorbent article further includes a fluid storage layer disposed between the topsheet and  
15 backsheet and having a body-facing surface and a garment-facing surface opposing the body-facing surface. The fluid storage layer contains a superabsorbent material. In one aspect of the invention, the disposable absorbent article further includes an odor reduction layer disposed at either the body-facing surface side or the body-facing surface side of the fluid storage  
20 layer. The odor reduction layer contains a metalphthalocyanine material. The disposable absorbent article further includes an isolation means disposed between the superabsorbent material and the odor reduction layer for isolating the metalphthalocyanine material from contacting at least a part of the superabsorbent material.

25 In another aspect of the invention, the disposable absorbent article further includes an odor reduction layer which envelops at least a part of the fluid storage layer. The odor reduction layer contains a metalphthalocyanine material. The disposable absorbent article further includes an isolation means disposed between the superabsorbent material and the odor reduction layer for  
30 isolating the metalphthalocyanine material from contacting at least a part of the superabsorbent material.

The foregoing answers the need for disposable absorbent articles whose absorptive capacity is not affected by the use of a metalphthalocyanine or its derivatives as an odor reduction material.

These and other features, aspects, and advantages of the present invention will become evident to those skilled in the art from reading of the present disclosure.

#### BRIEF DESCRIPTION OF THE DRAWING

While the specification concludes with claims particularly pointing out and distinctly claiming the invention, it is believed that the invention will be better understood from the following description of preferred embodiments which is taken in conjunction with the accompanying a drawing and which like designations are used to designate substantially identical elements, and in which:

Figure is a simplified plan view of one preferred embodiment of the disposable absorbent article of the present invention in its flat uncontracted condition showing the body-facing side of the garment.

#### DETAILED DESCRIPTION

All cited references are incorporated herein by reference in their entireties. Citation of any reference is not an admission regarding any determination as to its availability as prior art to the claimed invention.

Herein, "comprise" and "include" mean that other element(s) and step(s) which do not affect the end result can be added. These terms encompass the terms "consisting of" and "consisting essentially of".

Herein, "nonwoven" may include any material which has been formed without the use of textile weaving processes which produce a structure of individual fibers which are interwoven in an identifiable manner. Methods of making suitable nonwovens includes a carded nonwoven process, a spunbonded nonwoven process, a meltblown nonwoven process, or the like.

Herein, "layer" does not necessarily limit the element to a single strata of material in that a layer may actually comprise laminates or combinations of sheets or webs of the requisite types of materials.

Herein, "joined" or "joining" encompasses configurations whereby an element is directly secured to another by affixing the element directly to the other element, and configurations whereby the element is indirectly secured to the other element by affixing the element to intermediate member(s) which in turn are affixed to the other element.

Herein, "metaphthalocyanine material" encompasses a metaphthalocyanine, its derivatives, and any mixture materials thereof.

The absorbent structures of the present invention can be utilized in disposable absorbent articles which are capable of absorbing significant quantities of body fluids, such as urine and water in body wastes. Examples of such disposable absorbent articles include disposable underwears, disposable diapers (adult and baby) including pull-on diapers and training pants, disposable panties for menstrual use, and disposable absorbent pads including sanitary napkins.

The disposable absorbent article of the present invention includes a topsheet and a backsheet combined with the topsheet. The disposable absorbent article of the present invention generally includes three basic structural components: (1) a fluid storage layer disposed between the topsheet and backsheet, and containing a superabsorbent material; (2) an odor reduction layer disposed at either the body-facing surface side or the body-facing surface side, and containing a metaphthalocyanine material; and (3) an isolation means disposed between the superabsorbent material and the odor reduction layer for isolating the metaphthalocyanine material from contacting at least part of, preferably all of the superabsorbent material. In a preferred embodiment, the odor reduction layer is disposed adjacent to either the body-facing surface or the garment-facing surface of the fluid storage layer.

The odor reduction layer is preferably disposed between the topsheet and the fluid storage layer. The odor reduction layer may be disposed between the backsheet and the fluid storage layer. The isolation means is preferably disposed between the fluid storage layer and the odor reduction layer. More preferably, the odor reduction layer is disposed adjacent to either

the body-facing surface or the garment-facing surface of the fluid storage layer such that it can be in contact with of the fluid storage layer. The topsheet can be either liquid pervious or liquid impervious. In a preferred embodiment, the topsheet is liquid pervious. Similarly, the backsheet can be either liquid  
5 pervious or liquid impervious. In a preferred embodiment, the backsheet is liquid impervious. The liquid pervious topsheet and backsheet can be formed by treating them with a finishing oil or a surfactant well known in the art. Further, the liquid impervious backsheet can be formed by employing an impervious thin plastic film. In a preferred embodiment, the disposable  
10 absorbent article further includes; a liquid pervious topsheet, and a liquid impervious backsheet combined with the topsheet.

The odor reduction layer of the present invention can comprise a single layer of essentially 100% metalphthalocyanine material, or can also include a carrier means. Preferably, the odor reduction layer contains at least from  
15 about 0.001% to about 10%, by weight, of the metalphthalocyanine material, and from about 90% to about 99.999% of the carrier means. More preferably, the odor reduction layer contains at least from about 0.002% to about 0.6%, by weight, of the metalphthalocyanine material, and from about 99.998% to about 99.4% of the carrier means. In a preferred embodiment, the odor reduction  
20 layer contains about 0.3% of the metalphthalocyanine material, and about 99.7% of the carrier means. The metalphthalocyanine material can be contained in the odor reduction layer in any form which can be incorporated into the odor reduction layer.

Many body fluids have an unpleasant odor (or an malodor), or develop  
25 such an odor when in contact with air and/or bacteria for prolonged periods. Additionally, urine and/or other exudates absorbed into the fluid storage layer are converted to ammonia by urease produced by skin-flora, *i.e.*, a group of normal microorganisms on the skin. This ammonia, in turn, may cause dermatitis, rash and/or other forms of skin irritation. The principal function of  
30 the odor reduction layer is to reduce such an unpleasant odor which is contained in and/or may be developed from the body fluid absorbed and

retained in the fluid storage layer. The metalphthalocyanine material, upon contact with a body fluid, neutralizes the ammonia components contained in the absorbed body fluid through the neutralization.

The odor reduction layer may have a number of shapes and sizes. For example, the odor reduction layer is typically in the form of rectangular, hourglass, or asymmetrical. The odor reduction layer generally has a thickness or diameter between about 0.25 mm and about 10.0 mm. Preferably for use in absorbent products, the odor reduction layer are in the form of rectangular having a thickness of greater than about 250 microns. The odor reduction layer preferably has a thickness between about 0.5 mm and about 3 mm, typically about 1 mm.

As indicated hereinbefore, the odor reduction layer includes a metalphthalocyanine material. A preferred metalphthalocyanine material may have the following chemical structure:

The metalphthalocyanine material has the central metal (indicated by "M" in the above chemical structure) selected from the transition elements. In a preferred embodiment, the central metal of the metalphthalocyanine material is Ni(II), Fe(III), Co(II), Mn(II), Cu, or Zn(II).

In a more preferred embodiment for use of disposable diapers, the central metal of the metalphthalocyanine material is Fe(III) or Co(II).

Preferred metalphthalocyanine derivatives have -COOH as the functional group. Such preferred metalphthalocyanine derivatives can have either di, tetra or octa forms of -COOH. Alternatively, the metalphthalocyanine derivatives can have any form selected from the group consisting of from mono  
5 to octa forms of -SO<sub>3</sub>Na.

In a preferred embodiment, the odor reduction layer includes a carrier means which holds or keeps the metalphthalocyanine material within the fluid storage layer through physical or chemical bonds. Any materials known in the art can be used as the carrier means as long as it can hold or keep the  
10 metalphthalocyanine material therein. Preferred carrier means includes fibrous materials such as nonwoven webs, tissue webs, and fluffs of synthetic fibers or natural fibers such as cellulose fibers; foams, apertured polymeric webs or films; and the like. Preferably, at least 95%, more preferably at least 99% by weight of the metalphthalocyanine material is physically bonded to the  
15 component material of the carrier means, while the rest of the metalphthalocyanine material may remain unbonded or chemically bonded to some of the component material of the carrier means.

In a preferred embodiment, the carrier means is a nonwoven material. More preferably, the nonwoven material is a resin bonded nonwoven material  
20 formed by polyethylene terephthalate (PET) fibers. A preferred resin bonded nonwoven material which can be used as the carrier means is commercially available from PGI Nonwovens, USA, under Code No. 68500.

In an alternative preferred embodiment, the carrier means is formed by a natural fibrous material such as cellulose fibers in the form of fluff, which is  
25 conventionally utilized and generally referred to as "airfelt" in absorbent cores (or fluid storage layers).

In a preferred embodiment, the metalphthalocyanine material is dispersed uniformly throughout the carrier means. In an alternative preferred embodiment, the metalphthalocyanine material is dispersed non-uniformly in  
30 the carrier means, e.g., the basis weight of the metalphthalocyanine material changes horizontally, vertically or both within the odor reduction layer. For

example, the odor reduction layer can have a metalphthalocyanine material gradient in the horizontal direction, such as with more metalphthalocyanine material being present in regions of relatively high fluid handling requirements (i.e., near the region of fluid discharge) and less metalphthalocyanine material at lower demand regions. In another example, the basis weight of the metalphthalocyanine material may change in the vertical direction (i.e., the thickness direction) of the odor reduction layer.

In one embodiment, the metalphthalocyanine material is in the form of discrete particles. In a preferred embodiment, the particles of the metalphthalocyanine material are distributed in a fibrous material of the carrier means to form the odor reduction layer. Such an odor reduction layer is typically made by airlaying, wherein an airstream of the particles of the metalphthalocyanine material is metered into an airstream of the fibrous materials of the carrier means. Alternatively, the particles of the metalphthalocyanine material can be laminated between two or more webs of fibrous material such as nonwoven materials to form the odor reduction layer.

In a preferred embodiment, the basis weight of the odor reduction layer can range from about 0.002 to 0.012 g/cm<sup>2</sup>, more preferably from about 0.003 to 0.008 g/cm<sup>2</sup>, and yet more preferably from about 0.004 to 0.007 g/cm<sup>2</sup>.

The density and basis weight of the odor reduction layer does not need to be uniform throughout the layer. The odor reduction layer can contain regions of relatively higher and relatively lower density and basis weight. The density values for the odor reduction layer are calculated from basis weight and layer caliper measured under a confining pressure of 0.2 psi (1.43 kPa).

Other materials or agents can be used with the metalphthalocyanine material as an aid in producing the odor reduction layer. In a preferred embodiment, water is used in conjunction with the metalphthalocyanine material. The water functions to promote uniform dispersion of the metalphthalocyanine material on the surface of the carrier means and permeation of the metalphthalocyanine material into the surface region of the carrier means. The water is used in a proportion of less than about 20 parts by

weight (i.e., 0 parts to about 20 parts by weight), preferably in the range of from about 0.01 parts to about 20 parts by weight, more preferably in the range of from about 0.1 parts to about 10 parts by weight, per 100 parts by weight of the carrier means. The actual amount of water to be used will vary depending upon the kind of the component material and the carrier means.

In a more preferred embodiment, a viscosity control agent and/or a binding agent is/are additionally used in conjunction with the metalphthalocyanine material.

The viscosity control agent functions to further promote uniform dispersion of the metalphthalocyanine material on the surface of the carrier means and permeation of the metalphthalocyanine material into the surface region of the carrier means. A preferred viscosity control agent is a methlose.

The binding agent further promotes stronger and more flexible physical bond between the metalphthalocyanine material and the component material of the carrier means. A preferred binding agent is selected from the group consisting of carboxy methyl cellulose, polyurethane, polyfix, polyamine and a mixture thereof.

In a preferred embodiment wherein the carrier means is a resin bonded nonwoven material formed by polypropylene fibers, a methlose and a carboxy methyl cellulose are used as the viscosity control agent and the binding agent, respectively. The viscosity control agent is used in a proportion of less than about 40 parts by weight (i.e., 0 parts to about 40 parts by weight), preferably in the range of from about 0.001 parts to about 40 parts by weight, more preferably in the range of from about 0.01 parts to about 30 parts by weight, per 100 parts by weight of the carrier means. The binding agent is used in a proportion of less than about 40 parts by weight (i.e., 0 parts to about 40 parts by weight), preferably in the range of from about 0.001 parts to about 30 parts by weight, more preferably in the range of from about 0.1 parts to about 20 parts by weight, per 100 parts by weight of the carrier means. The actual amounts and kinds of the viscosity control agent and the binding agent to be

used vary depending upon the kinds of the metalphthalocyanine material and the component material of the nonwoven material.

In an alternative preferred embodiment wherein the carrier means is a resin bonded nonwoven material formed by polyethylene terephthalate (PET) fibers, the metalphthalocyanine material is contained in a mixture with water, a viscosity control agent (e.g., a methlose) and a binding agent (e.g., a carboxy methyl cellulose). The use of the water can provide the preferred penetration of the metalphthalocyanine material into the carrier means while also providing a necessary uniformity of dispersion of the metalphthalocyanine material. However, a mixture of all three agents is more preferred in order to control the amount of the penetration of the metalphthalocyanine material into the carrier means.

In an yet alternative preferred embodiment wherein the carrier means is a resin bonded nonwoven material formed by polyethylene terephthalate (PET) fibers, the metalphthalocyanine material is contained in a mixture with water, and two or more binding agents.

In a preferred embodiment, such binding agents is a mixture of a polyurethane and a polyamine. The polyurethane is used in a proportion of less than about 40 parts by weight (i.e., 0 parts to about 40 parts by weight), preferably in the range of from about 0.001 parts to about 40 parts by weight, more preferably in the range of from about 0.01 parts to about 30 parts by weight, per 100 parts by weight of the carrier means. The polyamine is used in a proportion of less than about 40 parts by weight (i.e., 0 parts to about 40 parts by weight), preferably in the range of from about 0.001 parts to about 30 parts by weight, more preferably in the range of from about 0.01 parts to about 20 parts by weight, per 100 parts by weight of the carrier means.

In an alternative preferred embodiment, such binding agents is a mixture of a carboxy methyl cellulose, a polyurethane and a polyfix. The carboxy methyl cellulose is used in a proportion of less than about 40 parts by weight (i.e., 0 parts to about 40 parts by weight), preferably in the range of from about 0.01 parts to about 40 parts by weight, more preferably in the range of from

about 0.1 parts to about 30 parts by weight, per 100 parts by weight of the carrier means. The polyurethane is used in a proportion of less than about 40 parts by weight (i.e., 0 parts to about 40 parts by weight), preferably in the range of from about 0.01 parts to about 30 parts by weight, more preferably in the range of from about 0.1 parts to about 20 parts by weight, per 100 parts by weight of the carrier means. The polyfix is used in a proportion of less than about 40 parts by weight (i.e., 0 parts to about 40 parts by weight), preferably in the range of from about 0.01 parts to about 30 parts by weight, more preferably in the range of from about 0.1 parts to about 20 parts by weight, per 100 parts by weight of the carrier means.

The pH of the metalphthalocyanine material solution needs to be controlled (or chosen) depending on the type of the metalphthalocyanine material and the functional group bonded therein. For example, in a preferred embodiment wherein the metalphthalocyanine material has a tetra -COOH or a mono-tetra sulfonate as the functional group, the pH of the metalphthalocyanine material solution is controlled between about 3 and 6, more preferably between about 4 and 5.

The metalphthalocyanine material solution may be applied to the carrier means by any of various techniques and apparatus used for applying solutions to materials including coating, dumping, pouring, spraying, atomizing, or immersing the solution on the carrier means. In a preferred embodiment, the metalphthalocyanine material solution is applied onto at least a portion of the carrier means. Preferably, the metalphthalocyanine material solution is coated onto the entire surface of most, preferably all, of the carrier means.

Alternatively, the metalphthalocyanine material solution can be generally mixed with component fibers of the carrier means before the formation of the carrier means. The method of mixing can be done by any of a number of mixing techniques and mixing apparatus known in the art as long as the component fibers of the carrier means can be fully coated with the metalphthalocyanine material solution. After the component fibers are

thoroughly coated with the metalphthalocyanine material solution, the formation for the carrier means is carried out to form the odor reduction layer.

The fluid storage layer can include a single layer of essentially 100% superabsorbent material. Preferably, the fluid storage layer includes a  
5 superabsorbent material and a carrier means for the superabsorbent material. The carrier means may be manufactured from a wide variety of liquid-absorbent materials commonly used in disposable diapers and other absorbent articles such as a comminuted wood pulp which is generally referred to as airfelt. Examples of other carrier means include creped cellulose  
10 wadding; meltblown polymers including coform; chemically stiffened, modified or cross-linked cellulosic fibers; tissue including tissue wraps and tissue laminates; absorbent foams; absorbent sponges; or any equivalent material or combinations of materials.

The fluid storage layer includes at least 15%, by weight, preferably at  
15 least 25%, of superabsorbent material (defined more fully hereafter), and from 0% to about 85%, preferably less than about 75%, of the carrier means. The principal function of the fluid storage layer is to absorb discharged body fluid and retain such fluid under the pressures encountered as a result of the wearer's movements.

As indicated hereinbefore, the fluid storage layer includes  
20 superabsorbent material such as, but not necessarily limited to, discrete particles of absorbent gelling material and superabsorbent fibrous material such as acrylate grafted fibers and superabsorbent modified cellulosic fibers. The superabsorbent material can be in any form which can be incorporated  
25 into the fibrous material of the carrier means to form the fluid storage layer. Superabsorbent materials are described in more detail below. The superabsorbent material, upon contact with fluids such as water or body fluids, absorb such fluids. The fluid discharged into the disposable absorbent article and transported to the fluid storage layer can be acquired and held by the  
30 superabsorbent material, thereby providing the articles herein with enhanced absorbent capacity and/or improved fluid retention performance.

The superabsorbent materials are those which are capable of absorbing at least about 10 grams, preferably at least about 15 g, more preferably at least about 20 g, of Synthetic Urine (1.0% NaCl aqueous solution) per gram of superabsorbent material, as determined according to the hereinafter described

5 Absorbent Capacity procedure.

The superabsorbent material utilized herein is typically in the form of discrete particles of absorbent gelling material. These particles are preferably distributed within a fibrous material of the carrier means. The fluid storage layer which has particles of the absorbent gelling material distributed in fibrous materials of the carrier means is typically made by airlaying, wherein an airstream of the particles of the absorbent gelling material is metered into an airstream of the fibrous materials of the carrier means. The superabsorbent fibrous material can include synthetic or natural fibers. Suitable natural fibrous material for the carrier means are cellulose fibers, in the form of fluff, such as is conventionally utilized and generally referred to as "airfelt" in absorbent cores (or fluid storage layers).

The average dry density of the fluid storage layer including the carrier means is generally in the range of from about 0.06 to about 0.5 g/cm<sup>3</sup>, more preferably within the range of from about 0.10 to about 0.4 g/cm<sup>3</sup>, yet more preferably from about 0.15 to about 0.3 g/cm<sup>3</sup>, and still more preferably from about 0.15 to about 0.25 g/cm<sup>3</sup>. Typically the basis weight of the fluid storage layer can range from about 0.02 to 0.12 g/cm<sup>2</sup>, more preferably from about 0.04 to 0.08 g/cm<sup>2</sup>, and yet more preferably from about 0.05 to 0.07 g/cm<sup>2</sup>.

The density and basis weight of the fluid storage layer does not need to be uniform throughout the layer. The fluid storage layer can contain regions of relatively higher and relatively lower density and basis weight. The density values for the fluid storage layer are calculated from basis weight and layer caliper measured under a confining pressure of 0.2 psi (1.43 kPa). The density and basis weight values include the weight of the superabsorbent material. Additionally, the fluid storage layer can have a superabsorbent material gradient, such as with more superabsorbent material being present in regions

of relatively high fluid handling requirements (i.e., near the region of fluid discharge) and less superabsorbent material at lower demand regions.

Preferably, the superabsorbent material which is employed in the fluid storage layer is a substantially water-insoluble, slightly cross-linked, partially neutralized, polymeric absorbent gelling material. This material forms a hydrogel upon contact with water. Such polymer materials can be prepared from polymerizable, unsaturated, acid-containing monomers. Suitable unsaturated acidic monomers for use in preparing the polymeric gelling material include those disclosed in U.S. Patent No. 4,654,039 issued to Brandt et al. on March 31, 1987 and reissued as U.S. Patent No. RE 32,649 on April 19, 1988. Preferred monomers include acrylic acid, methacrylic acid, and 2-acrylamido-2-methyl propane sulfonic acid. Acrylic acid is especially preferred for preparation of the polymeric gelling agent material.

The polymeric component formed from unsaturated, acid-containing monomers may be grafted on to other types of polymer moieties such as starch or cellulose. Polyacrylate grafted starch materials of this type are also especially preferred.

Preferred polymeric absorbent gelling materials which can be prepared from conventional types of monomers include hydrolyzed acrylonitrile grafted starch, polyacrylate grafted starch, polyacrylates, maleic anhydride-based copolymers and combinations thereof. Especially preferred are the polyacrylates and polyacrylate grafted starch.

Whatever the nature of the basic polymer components of the hydrogel-forming polymeric absorbent gelling material particles, such materials will in general be slightly cross-linked. Cross-linking agents serves to render the hydrogel-forming polymer gelling materials substantially water-insoluble, and cross-linking thus in part determines the gel volume and extractable polymer characteristics of the hydrogels formed from the polymeric gelling agents employed. Suitable cross-linking agents are well known in the art and include, for example, those described in greater detail in U.S. Patent No. 4,076,663 issued to Masuda et al. on February 28, 1978. Preferred cross-linking agents

are the di- or polyesters of unsaturated mono- or polycarboxylic acids with polyols, the bisacrylamides and the di-or triallyl amines. Other preferred cross-linking agents are N,N'-methylenebisacrylamide, trimethylol propane triacrylate and triallyl amine. The cross-linking agent can generally constitute from about  
5 0.001 mole percent to 5 mole percent of the resulting hydrogel-forming polymer material. More preferably, the cross-linking agent will constitute from about 0.01 mole percent to 3 mole percent of the hydrogel-forming polymeric gelling material particles used herein.

The slightly cross-linked, hydrogel-forming polymeric gelling material  
10 particles are generally employed in their partially neutralized form. Such materials are considered partially neutralized when at least 25 mole percent, and preferably at least 50 mole percent of monomers used to form the polymer are acid group-containing monomers which have been neutralized with a salt-forming cation. Suitable salt-forming cations include alkali metal, ammonium,  
15 substituted ammonium and amines. This percentage of the total monomers utilized which are neutralized acid group-containing monomers is referred to herein as the "degree of neutralization."

Alternatively, the particles of absorbent gelling material can be laminated between two or more webs of fibrous material to form the fluid  
20 storage layer, such as exemplified in U.S. Patent No. 4,578,068 issued to Kramer et al. on March 25, 1986.

The isolation means can be formed by any structure which can work for the isolation of the metalphthalocyanine material from the superabsorbent material. Such a structure for the isolation can be any structure which spaces  
25 the metalphthalocyanine material in the odor reduction layer away from contacting at least part of, preferably all of the superabsorbent material. In a preferred embodiment, the isolation means is an interposed material disposed between the odor reduction layer and the superabsorbent material. Preferred interposed materials for the isolation means include fibrous materials such as  
30 nonwoven webs, tissue webs, and fluffs of synthetic fibers or natural fibers such as cellulose fibers; foams, apertured polymeric webs or films; and the like.

In a preferred embodiment, the isolation means is a tissue layer or a nonwoven layer which is disposed between the fluid storage layer and the odor reduction layer. In a more preferred embodiment, such a tissue or nonwoven layer is also used for enveloping at least a part of, more preferably the entire portion of the fluid storage layer.

In an alternative preferred embodiment, the odor reduction layer envelops at least a part of, more preferably the entire portion of a fluid storage layer which includes a superabsorbent material and a carrier means for the superabsorbent material. In this embodiment, the carrier means also works as the isolation means. Preferably, the odor reduction layer is formed by a tissue or a nonwoven layer. Preferred isolation means for this particular embodiment may be formed by any material which are used for the carrier means of the fluid storage layer. In a preferred embodiment, the isolation means is a comminuted wood pulp (e.g., airfelt) which is contained in the fluid storage layer together with the superabsorbent material.

The basis weight of the isolation means can range from about 0.001 to 0.008 g/cm<sup>2</sup>, more preferably from about 0.0012 to 0.006 g/cm<sup>2</sup>, and yet more preferably from about 0.0013 to 0.005 g/cm<sup>2</sup>. In a preferred embodiment wherein the interposed material is a nonwoven material, the basis weight of the tissue material is about 0.0049 g/cm<sup>2</sup>.

The density and basis weight of the interposed material does not need to be uniform throughout the material. The interposed material can contain regions of relatively higher and relatively lower density and basis weight. The density values for the interposed material are calculated from basis weight and material caliper measured under a confining pressure of 0.2 psi (1.43 kPa). A preferred tissue material to be used as the interposed material is available from Fripa Co., Ltd., under Code No. 1110000.

Particularly preferred embodiments of the disposable absorbent article are disclosed hereinafter by referring to the drawing. Herein, "absorbent article" refers to devices which absorb and contain body exudates, and, more specifically, refers to devices which are placed against or in proximity to the

body of the wearer to absorb and contain the various exudates discharged from the body. Herein, "disposable" is used herein to describe absorbent articles which are not intended to be laundered or otherwise restored or reused as an absorbent article (i.e., they are intended to be discarded after a single use and, preferably, to be recycled, composted or otherwise disposed of in an environmentally compatible manner). A preferred embodiment of the disposable absorbent article of the present invention is a unitary disposable diaper 20, shown in Figure. Herein, "unitary" absorbent article refers to absorbent articles which are formed of separate parts united together to form a coordinated entity so that they do not require separate manipulative parts like a separate holder and liner. Herein, "diaper" refers to an absorbent article generally worn by infants and incontinent persons that is worn about the lower torso of the wearer. It should be understood, however, that the present invention is also applicable to other disposable absorbent articles such as disposable underwears, disposable diapers (adult and baby) including pull-on diapers and training pants, disposable panties for menstrual use, and disposable absorbent pads including sanitary napkins.

Figure is a plan view of the disposable diaper 20 in its flat-out, uncontracted state (i.e., with elastic induced contraction pulled out) with portions of the structure being cut-away to more clearly show the construction of the diaper 20 and with the portion of the diaper 20 which faces the wearer, the body-facing surface 40, facing the viewer. As shown in Figure, the diaper 20 preferably comprises a chassis 22 comprising a liquid pervious topsheet 24; a liquid impervious backsheet 26 joined to the topsheet; and a fluid storage layer 28 positioned between the topsheet 24 and the backsheet 26. The fluid storage layer 28 has a pair of opposing longitudinal edges 60. The diaper preferably further comprises side panels 30; elasticized leg cuffs 32; elasticized waistbands 34; and a fastening system 36 preferably comprising a pair of securement members 37 and a landing member 38.

The diaper 20 is shown in Figure to have a body-facing surface 40 (facing the viewer in Figure), a garment-facing surface 42 opposed to the body-

facing surface 40, a back region 44, a front region 46 opposed to the back region 44, a crotch region 48 positioned between the back region 44 and the front region 46, and a periphery which is defined by the outer perimeter or edges of the diaper 20 in which the side edges are designated 50 and the end edges are designated 52. The body-facing surface 40 of the diaper 20 comprises that portion of the diaper 20 which is positioned adjacent to the wearer's body during use (i.e., the body-facing surface 40 generally is formed by at least a portion of the topsheet 24 and other components joined to the topsheet 24). The garment-facing surface 42 comprises that portion of the diaper 20 which is positioned away from the wearer's body (i.e., the garment-facing surface 42 is generally formed by at least a portion of the backsheet 26 and other components joined to the backsheet 26). The back region 44 and the front region 46 extend from the end edges 52 of the periphery to the crotch region 48.

The diaper 20 also has two centerlines, a longitudinal centerline 100 and a transverse centerline 110. The term "longitudinal", as used herein, refers to a line, axis, or direction in the plane of the diaper 20 that is generally aligned with (e.g. approximately parallel with) a vertical plane which bisects a standing wearer into left and right halves when the diaper 20 is worn. The terms "transverse" and "lateral", as used herein, are interchangeable and refer to a line, axis or direction which lies within the plane of the diaper that is generally perpendicular to the longitudinal direction (which divides the wearer into front and back body halves).

The chassis 22 comprises the topsheet 24, the backsheet 26 and the fluid storage layer 28 having the pair of opposing longitudinal edges 60, the body-facing surface, and the garment-facing surface. The body-facing surface generally faces the body of the wearer while the garment-facing surface generally faces away from the body of the wearer (and the garment of the wearer). When the absorbent article comprises a separate holder and a liner, the chassis 22 generally comprises the holder and the liner (i.e., the chassis 22 comprises one or more layers of material to define the holder while the liner

comprises an absorbent composite such as a topsheet, a backsheet, and a fluid storage layer.) For unitary absorbent articles, the chassis 22 preferably comprises the topsheet 24, the backsheet 26 and the fluid storage layer 28 of the diaper with other features added to form the composite diaper structure.

5 In the embodiment shown in Figure, the topsheet 24 and the backsheet 26 have length and width dimensions generally larger than those of the fluid storage layer 28. The topsheet 24 and the backsheet 26 extend beyond the edges of the fluid storage layer 28 to thereby form the periphery of the diaper 20. While the topsheet 24, the backsheet 26, and the fluid storage layer 28  
10 may be assembled in a variety of well known configurations, exemplary chassis configurations are described generally in U.S. Patent No. 3,860,003 entitled "Contractible Side Portions for Disposable Diaper" which issued to Kenneth B. Buell on January 14, 1975; and U.S. Patent No. 5,151,092 entitled "Absorbent Article With Dynamic Elastic Waist Feature Having A Predisposed Resilient  
15 Flexural Hinge" which issued to Kenneth B. Buell et al., on September 29, 1992.

The fluid storage layer 28 may be any absorbent member which is generally compressible, conformable, non-irritating to the wearer's skin, and capable of absorbing and retaining liquids such as urine and other certain body  
20 exudates. As shown in Figure, the fluid storage layer 28 has a garment-facing side, a body-facing side, a pair of side edges, and a pair of waist edges. The fluid storage layer 28 may be manufactured in a wide variety of sizes and shapes (e.g., rectangular, hourglass, "T"-shaped, asymmetric, etc.). Preferably, the fluid storage layer 28 includes a superabsorbent material and a  
25 carrier means for the superabsorbent material. In this embodiment, the carrier means is preferably formed from comminuted wood pulp which is generally referred to as airfelt.

The configuration and construction of the fluid storage layer 28 may vary (e.g., the fluid storage layer may have varying caliper zones, a hydrophilic  
30 gradient, a superabsorbent gradient, or lower average density and lower average basis weight acquisition zones; or may comprise one or more layers or

structures). Further, the size and absorbent capacity of the fluid storage layer 28 may also be varied to accommodate wearers ranging from infants through adults. However, the total absorbent capacity of the fluid storage layer 28 should be compatible with the design loading and the intended use of the  
5 diaper 20.

One embodiment of the diaper 20 has an asymmetric, modified T-shaped fluid storage layer 28 having ears in the front region but a generally rectangular shape in the back region. Exemplary absorbent structures for use as the fluid storage layer 28 that have achieved wide acceptance and  
10 commercial success are described in U.S. Patent No. 4,610,678 entitled "High-Density Absorbent Structures" issued to Weisman et al. on September 9, 1986; U.S. Patent No. 4,673,402 entitled "Absorbent Articles With Dual-Layered Cores" issued to Weisman et al. on June 16, 1987; U.S. Patent No. 4,888,231 entitled "Absorbent Core Having A Dusting Layer" issued to  
15 Angstadt on December 19, 1989; and U.S. Patent No. 4,834,735, entitled "High Density Absorbent Members Having Lower Density and Lower Basis Weight Acquisition Zones", issued to Alemany et al. on May 30, 1989. The fluid storage layer may further comprise the dual core system containing an acquisition/distribution core of chemically stiffened fibers positioned over a fluid  
20 storage layer as detailed in U.S. Patent No. 5,234,423, entitled "Absorbent Article With Elastic Waist Feature and Enhanced Absorbency" issued to Alemany et al., on August 10, 1993; and in U.S. Patent No. 5,147,345, entitled "High Efficiency Absorbent Articles For Incontinence Management" issued to Young, LaVon and Taylor on September 15, 1992.

25 In a preferred embodiment, the diaper 20 further includes an odor reduction layer (not shown in Figure) of the present invention which is disposed between the topsheet 24 and the fluid storage layer 28. Alternatively, the odor reduction layer may be disposed between the backsheet 26 and the fluid storage layer 28.

30 In these embodiments, an isolation means (not shown in Figure) is formed by a tissue or nonwoven material which envelops at least a part of,

preferably the entire portion of the material of the carrier means. The portion of the isolation layer which disposed between the fluid storage layer and the odor reduction layer isolates the metalphthalocyanine material from contacting the superabsorbent material contained in the fluid storage layer 28. Preferably, the odor reduction layer is disposed on the either the body-facing surface or the garment-facing surface of the fluid storage layer 28 such that it can be in contact with of the fluid storage layer.

In an alternative preferred embodiment, the isolation means (not shown in Figure) is formed by a separate material from such a fluid storage layer enveloping material (i.e., a tissue or nonwoven material). Preferably, such a separate material (i.e., an isolation means) is disposed between the odor reduction layer and the fluid storage layer 28. A preferred separate material is a nonwoven material.

The topsheet 24 is preferably positioned adjacent the body-facing surface of the fluid storage layer 28 and is preferably joined thereto and to the backsheet 26 by attachment means (not shown) such as those well known in the art. Suitable attachment means are described with respect to joining the backsheet 26 to the fluid storage layer 28. In a preferred embodiment, the topsheet 24 and the backsheet 26 are joined directly to each other in the diaper periphery and are indirectly joined together by directly joining them to the fluid storage layer 28 by any suitable attachment means.

The topsheet 24 is preferably compliant, soft feeling, and non-irritating to the wearer's skin. Further, the topsheet 24 is preferably liquid pervious permitting liquids (e.g., urine) to readily penetrate through its thickness. A suitable topsheet 24 may be manufactured from a wide range of materials such as woven and nonwoven materials; polymeric materials such as apertured formed thermoplastic films, apertured plastic films, and hydroformed thermoplastic films; porous foams; reticulated foams; reticulated thermoplastic films; and thermoplastic scrims. Suitable woven and nonwoven materials can be comprised of natural fibers (e.g., wood or cotton fibers), synthetic fibers (e.g., polymeric fibers such as polyester, polypropylene, or polyethylene fibers)

or from a combination of natural and synthetic fibers. A preferred nonwoven material for the topsheet 24 is a carded nonwoven material of polypropylene which available from Amoco Fabrics, under Code No. Soft P-10, 23 Stly 007.

5 The topsheet 24 is preferably made of a hydrophobic material to isolate the wearer's skin from liquids which have passed through the topsheet 24 and are contained in the fluid storage layer 28 (i.e. to prevent rewet). If the topsheet 24 is made of a hydrophobic material, at least the body-facing surface of the topsheet 24 is treated to be hydrophilic so that liquids will transfer through the topsheet more rapidly. This diminishes the likelihood that body  
10 exudates will flow off the topsheet 24 rather than being drawn through the topsheet 24 and being absorbed by the fluid storage layer 28. The topsheet 24 can be rendered hydrophilic by treating it with a surfactant. Suitable methods for treating the topsheet 24 with a surfactant include spraying the topsheet 24 material with the surfactant and immersing the material into the surfactant. A  
15 more detailed discussion of such a treatment and hydrophilicity is contained in U.S. Patent No. 4,988,344 entitled "Absorbent Articles with Multiple Layer Absorbent Layers" issued to Reising, et al on January 29, 1991 and U.S. Patent No. 4,988,345 entitled "Absorbent Articles with Rapid Acquiring Absorbent Cores" issued to Reising on January 29, 1991.

20 An alternative preferred topsheet 24 comprises an apertured formed film. Apertured formed films are preferred for the topsheet because they are pervious to body exudates and yet non-absorbent and have a reduced tendency to allow liquids to pass back through and rewet the wearer's skin. Thus, the surface of the formed film which is in contact with the body remains  
25 dry, thereby reducing body soiling and creating a more comfortable feel for the wearer. Suitable formed films are described in U.S. Patent No. 3,929,135, entitled "Absorptive Structures Having Tapered Capillaries", which issued to Thompson on December 30, 1975; U.S. Patent No. 4,324,246 entitled "Disposable Absorbent Article Having A Stain Resistant Topsheet", which  
30 issued to Mullane, et al. on April 13, 1982; U.S. Patent No. 4,342,314 entitled "Resilient Plastic Web Exhibiting Fiber-Like Properties", which issued to Radel.

et al. on August 3, 1982; U.S. Patent No. 4,463,045 entitled "Macroscopically Expanded Three-Dimensional Plastic Web Exhibiting Non-Glossy Visible Surface and Cloth-Like Tactile Impression", which issued to Ahr et al. on July 31, 1984; and U.S. 5,006,394 "Multilayer Polymeric Film" issued to Baird on  
5 April 9, 1991.

The backsheet 26 is that portion of the diaper 20 which is generally positioned away from the wearer's skin and which prevents the exudates absorbed and contained in the fluid storage layer 28 from wetting articles which contact the diaper 20 such as bedsheets and undergarments. Thus, the  
10 backsheet 26 is preferably impervious to liquids (e.g., urine) and is preferably manufactured from a thin plastic film, although other flexible liquid impervious materials may also be used. (As used herein, the term "flexible" refers to materials which are compliant and will readily conform to the general shape and contours of the human body.) However, the backsheet 26 permits vapors  
15 to escape from the diaper 20. A suitable material for the backsheet 26 is a thermoplastic film having a thickness of from about 0.012 mm (0.5 mil) to about 0.051 mm (2.0 mils), preferably comprising polyethylene or polypropylene.

The backsheet 26 is preferably positioned adjacent the garment-facing surface of the fluid storage layer 28 and is preferably joined thereto by any  
20 suitable attachment means known in the art. For example, the backsheet 26 may be secured to the fluid storage layer 28 by a uniform continuous layer of adhesive, a patterned layer of adhesive, or an array of separate lines, spirals, or spots of adhesive. Adhesives which have been found to be satisfactory are manufactured by H. B. Fuller Company of St. Paul, Minnesota and marketed as  
25 HL-1258. An example of a suitable attachment means comprising an open pattern network of filaments of adhesive is disclosed in U.S. Patent No. 4,573,986 entitled "Disposable Waste-Containment Garment", which issued to Minetola et al. on March 4, 1986. Another suitable attachment means comprising several lines of adhesive filaments swirled into a spiral pattern is  
30 illustrated by the apparatus and methods shown in U.S. Patent No. 3,911,173 issued to Sprague, Jr. on October 7, 1975; U.S. Patent No. 4,785,996 issued

to Ziecker, et al. on November 22, 1978; and U.S. Patent No. 4,842,666 issued to Werenicz on June 27, 1989. Alternatively, the attachment means may comprise heat bonds, pressure bonds, ultrasonic bonds, dynamic mechanical bonds, or any other suitable attachment means or combinations of these attachment means as are known in the art.

Embodiments are also contemplated wherein the fluid storage layer 28 is not joined to the backsheet 26, and/or the topsheet 24 in order to provide greater extensibility in the front region 46 and the back region 44. Alternative embodiments are contemplated wherein an additional member, such as a liquid impervious barrier material(s) (not shown), is positioned between the garment-facing surface of the fluid storage layer 28 and the backsheet 28. Any such barrier member may or may not be joined to the fluid storage layer 28. Further, the backsheet 26 may or may not be joined to any barrier material(s) that are positioned between the backsheet 26 and the fluid storage layer 28.

The diaper 20 preferably further comprises an outer cover (not shown in Figure) joined with at least a portion of the garment-facing surface of the backsheet 26 forming a laminate. The outer cover preferably comprises a nonwoven material. (However, embodiments are contemplated wherein the outer cover comprises materials such as woven webs, foams, scrims, films, loose fibers, or any other material or combination of materials known in the art that will give the diaper a cloth-like look and/or feel and is at a minimum air permeable.) The outer cover may cover all or substantially all of the garment-facing surface of the backsheet 26, or may cover only discrete predetermined portions. In a preferred embodiment, the nonwoven material of the outer cover covers all or substantially all of the backsheet 26 in order to provide the diaper with a cloth-like look and feel. Further, the outer cover may provide the diaper with a low cost landing zone capable of engaging the hooks of a hook and loop type fastener. (Such a landing zone could be utilized as a portion of a primary fastening system or as a means for disposing of a soiled diaper.) Alternatively, the outer cover may cover only specific portions of the backsheet 26, such as the garment-facing surface of the side panels 30. In one such embodiment,

the outer cover is comprised in the breathable side panels 30. Thus, the outer cover may provide extra strength, bulk, aesthetic appeal or other characteristics desired in the breathable side panels 30.

The nonwoven material comprised in the outer cover is preferably liquid and air pervious. The nonwoven material may comprise natural fibers (e.g. cotton or wood fibers), or may comprise fibers of polyethylene, polypropylene, polyester, or any combination of such fibers. Further, the nonwoven may be carded, spunmelt, meltblown or air-through bonded or have any other characteristic or be manufactured in any manner known in the art. Preferably, the nonwoven is comprised of sufficient thermoplastic material to allow for thermal bonding of the material to other components of the diaper.

The diaper 20 preferably further comprises elasticized leg cuffs 32 for providing improved containment of liquids and other body exudates. Each elasticized leg cuff 32 may comprise several different embodiments for reducing the leakage of body exudates in the leg regions. (The leg cuff can be and is sometimes also referred to as leg bands, side flaps, barrier cuffs, or elastic cuffs.) U.S. Patent No. 3,860,003 describes a disposable diaper which provides a contractible leg opening having a side flap and one or more elastic members to provide an elasticized leg cuff (gasketing cuff). U.S. Patent No. 4,909,803 entitled "Disposable Absorbent Article Having Elasticized Flaps" issued to Aziz et al. on March 20, 1990, describes a disposable diaper having "stand-up" elasticized flaps (barrier cuffs) to improve the containment of the leg regions. U.S. Patent No. 4,695,278 entitled "Absorbent Article Having Dual Cuffs" issued to Lawson on September 22, 1987; and U.S. Patent No. 4,795,454 entitled "Absorbent Article Having Leakage-Resistant Dual Cuffs" issued to Dragoo on January 3, 1989, describe disposable diapers having dual cuffs including a gasketing cuff and a barrier cuff. U.S. Patent No. 4,704,115 entitled "Disposable Waist Containment Garment" issued to Buell on November 3, 1987, discloses a disposable diaper or incontinence garment having side-edge-leakage-guard gutters configured to contain free liquids within the garment.

It is preferred that each elasticized leg cuff 32 comprise at least an inner barrier cuff 70 comprising a barrier flap 68 and a spacing element 69 such as described in the above-referenced U.S. Patent No. 4,909,803. In a preferred embodiment, the elasticized leg cuff 32 additionally comprises an elastic gasketing cuff 63 with one or more elastic strands 65, positioned outboard of the barrier cuff such as described in the above-referred U.S. Patent No. 4,695,278. Further, the elasticized leg cuff 32 preferably has a proximal edge 33 and a distal edge 35. The distal edge 35 of the elasticized leg cuff 32 is that part of the elasticized leg cuff 32 which is spaced away from the chassis 22 of the diaper when the diaper 20 is being worn. The proximal edge 33 is that part of the elasticized leg cuff 32 which is joined to the chassis 22 of the diaper 20. The proximal edge 33 is generally located laterally inboard of the periphery of the diaper 20.

It may also be desirable to provide the diaper 20 with extensibility or elasticity in all or a portion of the side panels 30. (Herein, "extensible" refers to materials that are capable of extending in at least one direction to a certain degree without undue rupture. Herein, "elasticity" and "elastically extensible" refer to extensible materials that have the ability to return to approximately their original dimensions after the force that extended the material is removed. As used herein, any material or element described as "extensible" may also be elastically extensible unless otherwise provided.) Extensible side panels 30 provide a more comfortable and contouring fit by initially conformably fitting the diaper to the wearer and sustaining this fit throughout the time of wear well passed when the diaper has been loaded with exudates since the side panels allow the sides of the diaper to expand and contract. Extensible side panels 30 further provide more effective application of the diaper 20 since even if the diaperer pulls one side panel 30 farther than the other during the application (asymmetrically), the diaper 20 will "self-adjust" during wear. While the extensible side panels 30 may be constructed in a number of configurations, examples of diapers with extensible side panels are disclosed in U.S. Patent No. 4,857,067, entitled "Disposable Diaper Having Shirred Ears" issued to

Wood, et al. on August 15, 1989; U.S. Patent No. 4,381,781 issued to Sciaraffa, et al. on May 3, 1983; U.S. Patent No. 4,938,753 issued to Van Gompel, et al. on July 3, 1990; and in U.S. Patent No. 5,151,092 issued to Buell et al. on September 29, 1992.

5           The diaper 20 preferably further comprises an elasticized waistband 34 that provides improved fit and containment. The elasticized waistband 34 is that portion or zone of the diaper 20 which is intended to elastically expand and contract to dynamically fit the wearer's waist. The elasticized waistband 34 preferably extends longitudinally outwardly from at least one of the waist edges  
10 of the fluid storage layer 28 and generally forms at least a portion of the end edge of the diaper 20. Disposable diapers are generally constructed so as to have two elasticized waistbands, one positioned in the back region and one positioned in the front region, although diapers can be constructed with a single elasticized waistband. Further, while the elasticized waistband 34 or any  
15 of its constituent elements can comprise a separate element affixed to the diaper 20, the elasticized waistband 34 may be constructed as an extension of other elements of the diaper such as the backsheet 26 or the topsheet 24, preferably both the backsheet 26 and the topsheet 24. The elasticized waistband 34 may be constructed in a number of different configurations  
20 including those described in U.S. 4,515,595 entitled "Disposable Diapers With Elastically Contractible Waistbands" issued to Kievit & Osterhage on May 7, 1985, and in U.S. 5,151,092 entitled "Absorbent Article With Dynamic Elastic Waist Feature Having A Predisposed Resilient Flexural Hinge" issued to Buell, Clear & Falcone on September 29, 1992; and elasticized waistbands made  
25 from a structural elastic-like film (SELF) web as described in the previously referenced WO 95/03765.

In a preferred embodiment, the elasticized waistband 34 includes a laminate of a first nonwoven coverstock layer, an elastomeric layer, and more preferably a second nonwoven coverstock layer. The elastomeric layer can be  
30 formed by any elastomeric materials known in the art. The elasticized waistband 34 is preferably disposed on the body-facing surface or the garment-

facing surface of the topsheet 24 and operatively joined in an elastically contractible condition with the topsheet 24 to gather the elasticized waistband 34.

5 The diaper 20 also comprises a fastening system 36 which forms a side closure which maintains the back region 44 and the front region 46 in an overlapping configuration such that lateral tensions are maintained around the circumference of the diaper to maintain the diaper on the wearer. Exemplary fastening systems are disclosed in U.S. Patent No. 3,848,594 issued to Buell on November 19, 1974; U.S. Patent No. 4,662,875 issued to Hirotsu and  
10 Robertson on May 5, 1987; U.S. Patent No. 4,869,724 issued to Scripps on September 26, 1989; U.S. Patent No. 4,846,815 issued to Scripps on July 11, 1989; U.S. Patent No. 4,894,060 issued to Nestegard on January 16, 1990; U.S. Patent No. 4,946,527 issued to Battrell on August 7, 1990; and U.S. Patent No. 5,326,612 entitled "Nonwoven Female Component For  
15 Refastenable Fastening Device And Method of Making the Same" issued to David J. K. Goulait on July 5, 1994.

It is understood that the examples and embodiments described herein are for illustrative purpose only and that various modifications or changes will be suggested to one skilled in the art without departing from the scope of the  
20 present invention.

## WHAT IS CLAIMED IS:

1. A disposable absorbent article, comprising:  
a topsheet,  
a backsheet combined with the topsheet,  
a fluid storage layer disposed between the topsheet and backsheet and  
5 having a body-facing surface and a garment-facing surface opposing the body-facing surface, the fluid storage layer containing a superabsorbent material;  
an odor reduction layer disposed at either the body-facing surface side or the body-facing surface side of the fluid storage layer, the odor reduction layer containing a metalphthalocyanine material; and  
10 an isolation means disposed between the superabsorbent material and the odor reduction layer for isolating the metalphthalocyanine material from contacting at least a part of the superabsorbent material.
2. The disposable absorbent article of Claim 1, wherein the metalphthalocyanine material has the central metal selected from the transition elements.
3. The disposable absorbent article of Claim 2, wherein the central metal is Ni(II), Fe(III), Co(II), Mn(II), Cu, or Zn(II).
4. The disposable absorbent article of Claim 1, wherein the odor reduction layer includes at least about from 0.001% to about 10%, by weight, of the metalphthalocyanine material, and from about 90% to about 99.999% of a carrier means.  
5
5. The disposable absorbent article of Claim 1, wherein the odor reduction layer disposed adjacent to either the body-facing surface or the garment-facing surface of the fluid storage layer.

6. The disposable absorbent article of Claim 4, wherein the carrier means is a nonwoven material.
7. The disposable absorbent article of Claim 1, wherein the isolation means is a tissue or nonwoven layer disposed between the fluid storage layer and the odor reduction layer.
8. The disposable absorbent article of Claim 1, wherein the odor reduction layer further contains a viscosity control agent or a binding agent.
9. The disposable absorbent article of Claim 1, wherein the binding agent is selected from the group consisting of carboxy methyl cellulose, polyurethane, polyfix, polyamine and a mixture thereof.
10. A disposable absorbent article, comprising:
  - a topsheet,
  - a backsheet combined with the topsheet,
  - a fluid storage layer disposed between the topsheet and backsheet and
  - 5 having a body-facing surface and a garment-facing surface opposing the body-facing surface, the fluid storage layer containing a superabsorbent material;
  - an odor reduction layer which envelops at least a part of the fluid storage layer, the odor reduction layer containing a metalphthalocyanine material; and
  - 10 an isolation means disposed between the superabsorbent material and the odor reduction layer for isolating the metalphthalocyanine material from contacting at least a part of the superabsorbent material.

# INTERNATIONAL SEARCH REPORT

International Application No

PCT/US 00/12161

## A. CLASSIFICATION OF SUBJECT MATTER

IPC 7 A61F13/15

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 A61F A61L

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, WPI Data, PAJ

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

| Category ° | Citation of document, with indication, where appropriate, of the relevant passages  | Relevant to claim No. |
|------------|---|-----------------------|
| Y          | EP 0 386 723 A (AHSU KURIN KK, NISSHIN SEIFUN KK, NIPPON SHOKUBAI KAGAKU KOGYO CO LTD) 12 September 1990 (1990-09-12)<br>page 2, line 1 -page 3, line 25<br>page 4, line 40-49<br>page 7, line 1,2<br>--- | 1-10                  |

☒ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

° Special categories of cited documents :

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&" document member of the same patent family

Date of the actual completion of the international search

1 September 2000

Date of mailing of the international search report

12/09/2000
